NHI Discovery: identities page testing sheet (7/11/2026), status

The sheet's findings sorted into: fixed now, not a bug, and not fixed now because a change could break the website or needs production data. Rows with no finding (filters, sort, details, tags, activity counts, sessions, raw) are verification steps with no failure recorded. Prepared 11/11/2026 from branch ccr-a99e60a2-l35hoj.

1. Fixed now

Area	Finding	What was wrong	What was done	Confidence
All identities · Owner column	The age of some identities is missing	Age comes only from the creation date AWS reports, and AWS gives none for some resource types.	When there is no creation date the column shows "First seen N days ago" (when discovery first found it), with an explanation on hover.	Certain
Identity · Overview · Risk card	Shows 2 risks, but the full report has many more	The card counts the few quick signals of the discovery scan; Posture lists every failed security check. Both were called "risks".	Renamed "Risk signals"; it says these are the quick signals and that the full, longer list of failed checks is on the Posture tab (link).	Certain
Posture · environment check	"Missing or invalid environment": tag or Lambda environment variables?	The check name does not say it is about a tag.	The check explains it is about the environment tag on the resource, not Lambda environment variables, and why it can still fail when a tag exists.	Certain
Identities tabs	Idle 30+ days tab (your request)	-	Removed. The idle filter is still in the filter panel.	Certain
Relationships	"If either is taken over, both are" (your request)	Unclear sentence.	Now: "Shared access: X also runs as , so it has exactly the same permissions as this identity. Anyone who gains control of one of them can use those permissions."	Certain

2. Not a bug

Area	Finding	Why
Posture · environment check	The identity has an environment tag but the check says it has none	The check accepts only the tag keys and values the posture rules recognise, and reads the tags from the last scan. A tag added later, or with another key or value, still fails until it matches and a scan runs. The new note in the check says this.

3. Not fixed now: needs production data

Area	Finding	What is behind it	What is needed
Identity · Permissions	Summary counts (allowed, used 90 days, never used, shared) do not match the list below	The summary now uses the same rule as the rows (fixed in an earlier round). What can still differ: "actions allowed" counts expanded actions (a wildcard like s3:* is many actions) while the list has one row per policy entry.	The identity name and the numbers on screen, to check the remaining difference against its policies.
Identity · Permissions	"Where the permissions come from" card shows no data	The card reads the policy source of each permission from the scan; when the scanner did not record it, the card is empty.	The identity name, to see whether the scan recorded the policy sources.

Area	Finding	What is behind it	What is needed
Identity · Permissions	"Used (90 days)" flag does not match	The flag comes from CloudTrail activity in the last 90 days; when CloudTrail cannot be read the page says unknown, not unused.	The identity name and one action that was used, with its time.
